The goal is to develop a strategic epistemic logic for agents with arbitrary memory abilities.

Much work has already been done on epistemic ATL, but it is mostly either perfect recall or memoryless situations.

We allow each agent to have an arbitrary equivalence relation on histories.

Agents’ strategies and knowledge are based on these equivalence relations, so we consider their abilities to act, their knowledge, and the relationship between them.
The goal is to develop a strategic epistemic logic for agents with *arbitrary* memory abilities.

Much work has already been done on epistemic ATL, but it is mostly either perfect recall or memoryless situations.

We allow each agent to have an arbitrary equivalence relation on histories.

Agents’ strategies and knowledge are based on these equivalence relations, so we consider their abilities to act, their knowledge, and the relationship between them.
Combining Strategic and Epistemic Reasoning

- The goal is to develop a strategic epistemic logic for agents with arbitrary memory abilities.
- Much work has already been done on epistemic ATL, but it is mostly either perfect recall or memoryless situations.
- We allow each agent to have an arbitrary equivalence relation on histories.
- Agents’ strategies and knowledge are based on these equivalence relations, so we consider their abilities to act, their knowledge, and the relationship between them.
The goal is to develop a strategic epistemic logic for agents with arbitrary memory abilities.

Much work has already been done on epistemic ATL, but it is mostly either perfect recall or memoryless situations.

We allow each agent to have an arbitrary equivalence relation on histories.

Agents’ strategies and knowledge are based on these equivalence relations, so we consider their abilities to act, their knowledge, and the relationship between them.
Our contributions

We develop a strategic, epistemic logic based on uniform strategies.

- We allow agents to have arbitrary equivalence relations on histories,
- Our logic allows different agents to have different memory abilities,
- We present a new version of “perfect recall” for agents, allowing agents to reason about their own actions.
Epistemic Concurrent Game Structures

$$\langle Q, \Pi, \Sigma, B, \sim, \pi, Av, \delta \rangle$$

- $Q$: states,
- $\Pi$: propositions,
- $\Sigma$: finite set of agents, $\{a_1, ..., a_n\}$,
- $B$: finite set of actions,
- $\sim: \Sigma \rightarrow \mathcal{P}(Q \times Q)$: equivalence relation on states for each agent,
- $\pi: Q \rightarrow \Pi$: valuation,
- $Av: Q \times \Sigma \rightarrow \mathcal{P}(B)$: the available actions for an agent at a state,
- $\delta: Q \times \Sigma \times B \rightarrow \mathcal{P}(Q)$: transition function.
Epistemic Concurrent Game Structures

$\langle Q, \Pi, \Sigma, \mathcal{B}, \sim, \pi, Av, \delta \rangle$

Requirements:

- **Indistinguishable states.** If $q_1 \sim_i q_2$, then $Av(q_1, a_i) = Av(q_2, a_i)$: if two states are indistinguishable for $a_i$, then the same actions are available to $a_i$.

- **Action availability.** $Av(q, a_i) \neq \emptyset$: every agent has at least one action available at every state.

- **Determinacy:** when every agent chooses an available action, this leads to exactly one next state.
Histories and Strategies

A history is a sequence $q_0 . b_1^* . q_1 . b_2^* . q_2 . . . q_{k-1} . b_k^* . q_k$ where each $q_j \in Q$, $b_j \in B^n$, such that $q_j$ is the $b_j^*$ successor of $q_{j-1}$ (technically, $\{q_j\} = \bigcap_{i=1}^{n} \delta(q_{j-1}, a_i, b_i)$)

Given an arbitrary equivalence relation $\approx_i$ on histories, a uniform strategy for $a_i$ is a function $f : Hist \rightarrow B$ satisfying the following requirements:

- for all $h \in Hist$, $f_i(h)$ is an available action for $a_i$ in $h$, and
- if $h_1 \approx_i h_2$ then $f(h_1) = f(h_2)$. 
Most work on epistemic ATL considers two possibilities for memory: either \textit{perfect recall} or \textit{memoryless}.

Furthermore, all agents in a system are assumed to have the \textit{same memory capabilities}.

We generalize the notion of memory in several ways.
- Allow \textit{arbitrary} equivalence relations on histories.
- Allow different agents to have different memory capabilities.
- New notion of perfect recall, taking \textit{actions} into account.
Arbitrary equivalence relations

In other work, agents’ equivalence relations on histories are derivable from their equivalence relations on states—usually, memoryless or remembering all past states.

We allow a more general definition: each agent can have any equivalence relation on histories.

This means we consider more general systems. Examples:

- Agent remembers all past states except a certain state that is “invisible” to him,
- An agent who remembers half the states the system has been in,
- Agent remembers entire history until the system enters $s_0$, which wipes out his memory.

This generalization is similar to allowing agents in traditional, static Kripke models to have arbitrary equivalence relations on the set of states.
Different agents with different memory abilities

In other work, all agents are assumed to have the same memory capabilities—e.g. all memoryless or all with perfect recall.

Since we allow arbitrary equivalence relations, each agent can have a different type of memory.

Practical examples:

- A system where some simple agents with limited memory interact with sophisticated agents who remember everything, or
- A system with friendly agents of known memory ability and adversarial agents of unknown ability. Taking adversaries as perfect recall agents models a worst-case scenario, e.g. to check security properties.
Example 1: Agents with different memory abilities

Two agents: $a_1$ controls a lightswitch, is memoryless and blind. $a_2$ can turn over card: red on one side, green on other. Perfect recall.

**Propositions:**
- $r$: red
- $g$: green
- $l$: light on

**Actions:**
- $s$: flip lightswitch
- $t$: turn card over
- $n$: do nothing
Example I: Agents with different memory abilities

Formulas:

\[
q_2 \models \langle \{a_2\} \rangle \circ g
\]

\[
q_2 \models \langle \{a_2\} \rangle \circ \langle \{a_2\} \rangle \circ g
\]

\[
q_2 \models \langle \{a_1, a_2\} \rangle \circ g
\]

\[
q_2 \models \langle \{a_1, a_2\} \rangle \circ \langle \{a_1, a_2\} \rangle \circ g
\]

\[
q_2 \models \langle \{a_1, a_2\} \rangle \Diamond g
\]
Example I: Agents with different memory abilities

**Formulas:**

\[ q_2 \not|= \langle\{a_2\}\rangle \circ g \]

\[ q_2 \models \langle\{a_2\}\rangle \circ \langle\{a_2\}\rangle \circ g \]

\[ q_2 \models \langle\{a_1, a_2\}\rangle \circ g \]

\[ q_2 \models \langle\{a_1, a_2\}\rangle \circ \langle\{a_1, a_2\}\rangle \circ g \]

\[ q_2 \models \langle\{a_1, a_2\}\rangle \Diamond g \]
Example I: Agents with different memory abilities

Formulas:

$q_2 \not\models \langle\langle \{a_2\} \rangle \rangle \mathbin{\circ} g$

$q_2 \not\models \langle\langle \{a_2\} \rangle \rangle \mathbin{\circ} \langle\langle \{a_2\} \rangle \rangle \mathbin{\circ} g$

$q_2 \models \langle\langle \{a_1, a_2\} \rangle \rangle \mathbin{\circ} g$

$q_2 \models \langle\langle \{a_1, a_2\} \rangle \rangle \mathbin{\circ} \langle\langle \{a_1, a_2\} \rangle \rangle \mathbin{\circ} g$

$q_2 \models \langle\langle \{a_1, a_2\} \rangle \rangle \mathbin{\Diamond} g$
Example I: Agents with different memory abilities

Formulas:

\[ q_2 \not\models \llbracket \{a_2\} \rrbracket \circ g \]

\[ q_2 \not\models \llbracket \{a_2\} \rrbracket \circ \llbracket \{a_2\} \rrbracket \circ g \]

\[ q_2 \not\models \llbracket \{a_1, a_2\} \rrbracket \circ g \]

? 
\[ q_2 \models \llbracket \{a_1, a_2\} \rrbracket \circ \llbracket \{a_1, a_2\} \rrbracket \circ g \]

? 
\[ q_2 \models \llbracket \{a_1, a_2\} \rrbracket \Diamond g \]
Example I: Agents with different memory abilities

Formulas:

$q_2 \not\models \langle\langle \{a_2\} \rangle\rangle \circ g$

$q_2 \not\models \langle\langle \{a_2\} \rangle\rangle \circ \langle\langle \{a_2\} \rangle\rangle \circ g$

$q_2 \not\models \langle\langle \{a_1, a_2\} \rangle\rangle \circ g$

$q_2 \models \langle\langle \{a_1, a_2\} \rangle\rangle \circ \langle\langle \{a_1, a_2\} \rangle\rangle \circ g$

$q_2 \models \langle\langle \{a_1, a_2\} \rangle\rangle \boxdot g$
Example I: Agents with different memory abilities

Formulas:

\[ q_2 \not\models \langle\{a_2\}\rangle \circ g \]

\[ q_2 \not\models \langle\{a_2\}\rangle \circ \langle\{a_2\}\rangle \circ g \]

\[ q_2 \not\models \langle\{a_1, a_2\}\rangle \circ g \]

\[ q_2 \models \langle\{a_1, a_2\}\rangle \circ \langle\{a_1, a_2\}\rangle \circ g \]

\[ q_2 \models \langle\{a_1, a_2\}\rangle \boxdot g \]
New definition of perfect recall

Traditional definition: \( q_0.a_1^*.q_1.a_2^*.q_2...q_k \approx_i r_0.b_1^*.r_1.b_2^*.r_3...r_k \) iff \( q_j \sim_i r_j \) for \( j \in \{0, ..., k \} \). Only looks at states.

New definition: two histories are equivalent for \( a_i \) if all past states are equivalent and \( a_i \) took the same action in both histories at every step in the past.

**Definition (Perfect recall equivalence)**

\[ h_1 \approx_i h_2, \text{ iff either } h_1 = q_1 \text{ and } h_2 = q_2 \text{ and } q_1 \sim_i q_2, \text{ or } \]
\[ h_1 = q_0.b_1^*.q_1...q_{j-1}.b_j^*.q_j \text{ and } h_2 = r_0.c_1^*.r_1...r_{j-1}.c_j^*.r_j \text{ and:} \]

1. \( q_0.b_1^*.q_1...q_{j-1} \approx_i r_0.c_1^*.r_1...r_{j-1}, \) and
2. \( q_j \sim_i r_j, \) and
3. \( b_i = c_i \text{ where } b_j^* = \langle b_1, ..., b_n \rangle \text{ and } c_j^* = \langle c_1, ..., c_n \rangle. \)
New definition of perfect recall

Traditional definition: \( q_0.a_1^*.q_1.a_2^*.q_2...q_k \approx_i \) \( r_0.b_1^*.r_1.b_2^*.r_3...r_k \) iff \( q_j \sim_i r_j \) for \( j \in \{0, ..., k\} \).

Only looks at states.

New definition: two histories are equivalent for \( a_i \) if all past states are equivalent and \( a_i \) took the same action in both histories at every step in the past.

Definition (Perfect recall equivalence)

\[ h_1 \approx_i h_2, \text{ iff either } h_1 = q_1 \text{ and } h_2 = q_2 \text{ and } q_1 \sim_i q_2, \text{ or } \]
\[ h_1 = q_0.b_1^*.q_1...q_{j-1}.b_j^*.q_j \text{ and } h_2 = r_0.c_1^*.r_1...r_{j-1}.c_j^*.r_j \text{ and:} \]

1. \( q_0.b_1^*.q_1...q_{j-1} \approx_i r_0.c_1^*.r_1...r_{j-1}, \) and
2. \( q_j \sim_i r_j, \) and
3. \( b_i = c_i \text{ where } b_j^* = \langle b_1, ..., b_n \rangle \text{ and } c_j^* = \langle c_1, ..., c_n \rangle. \)
Example II: Recalling actions

A robot is in a simple maze shaped like this:

Robot has a position and an orientation. Robot perceives only the walls around him.
Example II: equivalence relation

So, these two states are indistinguishable for the robot:

$s_1 \sim s_2 \sim s_3 \sim (s_3, e) \sim (s_5, s)$
Example II: equivalence relation

But these two states are distinguishable:

\[
\begin{array}{c}
S_1 \\
S_4 \\
S_5 \\
(s_2, n)
\end{array}
\sim
\begin{array}{c}
S_1 \\
S_4 \\
S_5 \\
(s_4, n)
\end{array}
\]
Example II: equivalence relation

And these two states are distinguishable:

\[ (s_1, e) \sim (s_1, w) \]
Example II: actions

The robot’s actions are go left, right, forward, and back, \( l, r, f, b \). The actions \( l, r, \) and \( b \) change the orientation as you would expect, but \( f \) does not change the orientation.

Every action changes the position if the space in that direction is free; otherwise, the position stays the same. E.g. right action:

\[
\begin{align*}
\text{s1} & \quad \text{s2} \quad \text{s3} \\
\text{s4} & \quad \ldots \\
\text{s5} & \quad \\
\end{align*}
\]

\( (s_2, e) \)

\[
\begin{align*}
\text{s1} & \quad \text{s2} \quad \text{s3} \\
\text{s4} & \quad \downarrow \\
\text{s5} & \quad \\
\end{align*}
\]

\( (s_4, s) \)
Example II: actions

The robot’s actions are go left, right, forward, and back, \( l, r, f, b \).
The actions \( l, r, \) and \( b \) change the orientation as you would expect, but \( f \) does not change the orientation.
Every action changes the position if the space in that direction is free; otherwise, the position stays the same. E.g. left action:
Example II: histories

So, which histories can the robot distinguish?
If the robot is memoryless this is obvious.
If the robot has perfect recall, we will say that it can remember its actions, not just the past states. Consider the following pair of histories:

\[
\begin{align*}
    h_1 &= (s_5, n).f.(s_4, n).f.(s_2, n).l.(s_1, w) \\
    h_2 &= (s_5, n).f.(s_4, n).f.(s_2, n).r.(s_3, e)
\end{align*}
\]
Example II: histories

So, which histories can the robot distinguish?
If the robot is memoryless this is obvious.
If the robot has perfect recall, we will say that it can remember its actions, not just the past states. Consider the following pair of histories:

\[ h_1 = (s_5, n).f.(s_4, n).f.(s_2, n).l.(s_1, w) \]
\[ h_2 = (s_5, n).f.(s_4, n).f.(s_2, n).r.(s_3, e) \]
Example II: histories

So, which histories can the robot distinguish?
If the robot is memoryless this is obvious.
If the robot has perfect recall, we will say that it can remember its actions, not just the past states. Consider the following pair of histories:

\[ h_1 = (s_5, n).f.(s_4, n).f.(s_2, n).l.(s_1, w) \]
\[ h_2 = (s_5, n).f.(s_4, n).f.(s_2, n).r.(s_3, e) \]
Example II: histories

So, which histories can the robot distinguish?
If the robot is memoryless this is obvious.
If the robot has perfect recall, we will say that it can remember its actions, not just the past states. Consider the following pair of histories:

\[
\begin{align*}
h_1 &= (s_5, n).f.(s_4, n).f.(s_2, n).l.(s_1, w) \\
h_2 &= (s_5, n).f.(s_4, n).f.(s_2, n).r.(s_3, e)
\end{align*}
\]
Example II: histories

\[ h_1 = (s_5, n).f.(s_4, n).f.(s_2, n).l.(s_1, w) \]

\[ h_2 = (s_5, n).f.(s_4, n).f.(s_2, n).r.(s_3, e) \]

Traditional definition of perfect recall: \( h_1 \approx h_2 \)

Our definition of perfect recall: \( h_1 \not\approx h_2 \) because \( l \neq r \).
Example II: histories

\[ h_1 = (s_5, n).f.(s_4, n).f.(s_2, n).l.(s_1, w) \]

\[ h_2 = (s_5, n).f.(s_4, n).f.(s_2, n).r.(s_3, e) \]

Traditional definition of perfect recall: \( h_1 \approx h_2 \)
Our definition of perfect recall: \( h_1 \not\approx h_2 \) because \( l \neq r \).
Sophia Knight
A Strategic Epistemic Logic for Bounded Memory Agents
The syntax of uATEL:

$$\phi ::= p \mid \neg \phi \mid \phi \lor \phi \mid K_i \phi \mid C_A \phi \mid \langle A \rangle \bigodot \phi \mid \langle A \rangle \Box \phi \mid \langle A \rangle \phi U \phi$$

where $p \in \Pi$, $i \in \Sigma$, and $A \subseteq \Sigma$.

$K_i$: knowledge

$C_A$: common knowledge
In order to express knowledge, we must define our semantics over (finite) histories.

\[ L, h \models p \iff p \in \pi(\text{last}(h)) \]

Semantics for \(\neg \phi, \phi_1 \lor \phi_2, K_i \phi,\) and \(C_A \phi\) are standard.

\[ L, h \models \langle A \rangle \Diamond \phi \iff \exists \text{ group strategy } F_A \text{ for } A \text{ such that } \forall h' \approx^*_A h, \forall \lambda \in \text{out}(h', F_A), L, \lambda[0, |h'| + 1] \models \phi, \]

\[ L, h \models \langle A \rangle \Box \phi \iff \exists \text{ group strategy } F_A \text{ for } A \text{ such that } \forall h' \approx^*_A h, \forall \lambda \in \text{out}(h', F_A), L, \lambda[0, |h'| + n] \models \phi \text{ for all } n \geq 0 \]

\[ L, h \models \langle A \rangle \phi_1 \mathcal{U} \phi_2 \iff \exists \text{ group strategy } F_A \text{ for } A \text{ s.t. } \forall h' \approx^*_A h, \forall \lambda \in \text{out}(h', F_A), \exists m \in \mathbb{N} \text{ s.t. } L, \lambda[0, |h'| + m] \models \phi_2 \text{ and } \forall n \in \{0, \ldots, m - 1\}, L, \lambda[0, |h'| + n] \models \phi_1 \]
Next operator

\[ L, h \models \langle A \rangle \Box \phi \text{ iff } \exists \text{ group strategy } F_A \text{ for } A \text{ such that } \forall h' \approx^*_A h, \]
\[ \forall \lambda \in \text{out}(h', F_A), L, \uplambda[0, |h'| + 1] \models \phi, \]

This means that there is a successful group strategy (a set of strategies, one for each agent in the group), and it is common knowledge for the group that the strategy will succeed from the current history.

This corresponds to the intuitive notion of a group of agents being able to achieve a goal.
Validities

\[ L, h \models \langle A \rangle \circ \phi \iff \exists \text{ group strategy } F_A \text{ for } A \text{ such that } \forall h' \approx^*_A h, \forall \lambda \in \text{out}(h', F_A), L, \lambda[0, |h'| + 1] \models \phi, \]

This means that there is a successful group strategy (a set of strategies, one for each agent in the group), and it is common knowledge for the group that the strategy will succeed from the current history.

This corresponds to the intuitive notion of a group of agents being able to achieve a goal.
Validities

For perfect recall agents:

\[ \langle \Gamma \rangle \square \phi \leftrightarrow (C_\Gamma \phi \land \langle \Gamma \rangle \circ \langle \Gamma \rangle \square \phi) . \]

\[ \langle \Gamma \rangle \circ \phi \leftrightarrow \langle \Gamma \rangle \circ C_\Gamma \phi \leftrightarrow C_\Gamma \langle \Gamma \rangle \circ \phi , \]

\[ \langle \Gamma \rangle \square \phi \leftrightarrow \langle \Gamma \rangle \square C_\Gamma \phi \leftrightarrow C_\Gamma \langle \Gamma \rangle \square \phi , \]

and

\[ \langle \Gamma \rangle \phi_1 U \phi_2 \leftrightarrow C_\Gamma \langle \Gamma \rangle \phi_1 U \phi_2 . \]

but NOT

\[ \langle \Gamma \rangle a \phi_1 U \phi_2 \rightarrow \langle \Gamma \rangle a C_\Gamma \phi_1 U C_\Gamma \phi_2 . \]
Validities

For perfect recall agents:

\[
\langle\langle \Gamma \rangle\rangle \square \phi \leftrightarrow (C_\Gamma \phi \land \langle\langle \Gamma \rangle\rangle \circ \langle\langle \Gamma \rangle\rangle \square \phi).
\]

\[
\langle\langle \Gamma \rangle\rangle \circ \phi \leftrightarrow \langle\langle \Gamma \rangle\rangle \circ C_\Gamma \phi \leftrightarrow C_\Gamma \langle\langle \Gamma \rangle\rangle \circ \phi,
\]

\[
\langle\langle \Gamma \rangle\rangle \square \phi \leftrightarrow \langle\langle \Gamma \rangle\rangle \square C_\Gamma \phi \leftrightarrow C_\Gamma \langle\langle \Gamma \rangle\rangle \square \phi,
\]

and

\[
\langle\langle \Gamma \rangle\rangle \phi_1 U \phi_2 \leftrightarrow C_\Gamma \langle\langle \Gamma \rangle\rangle \phi_1 U \phi_2.
\]

but NOT

\[
\langle\langle \Gamma \rangle\rangle _a \phi_1 U \phi_2 \rightarrow \langle\langle \Gamma \rangle\rangle _a C_\Gamma \phi_1 U C_\Gamma \phi_2.
\]
Validities

For perfect recall agents:

\[ \langle\langle \Gamma \rangle\rangle \Box \phi \leftrightarrow (C_{\Gamma} \phi \land \langle\langle \Gamma \rangle\rangle \circ \langle\langle \Gamma \rangle\rangle \Box \phi) . \]

\[ \langle\langle \Gamma \rangle\rangle \circ \phi \leftrightarrow \langle\langle \Gamma \rangle\rangle \circ C_{\Gamma} \phi \leftrightarrow C_{\Gamma} \langle\langle \Gamma \rangle\rangle \circ \phi , \]

\[ \langle\langle \Gamma \rangle\rangle \Box \phi \leftrightarrow \langle\langle \Gamma \rangle\rangle \Box C_{\Gamma} \phi \leftrightarrow C_{\Gamma} \langle\langle \Gamma \rangle\rangle \Box \phi , \]

and

\[ \langle\langle \Gamma \rangle\rangle \phi_1 \mathcal{U} \phi_2 \leftrightarrow C_{\Gamma} \langle\langle \Gamma \rangle\rangle \phi_1 \mathcal{U} \phi_2 . \]

but NOT

\[ \langle\langle \Gamma \rangle\rangle a \phi_1 \mathcal{U} \phi_2 \rightarrow \langle\langle \Gamma \rangle\rangle a C_{\Gamma} \phi_1 \mathcal{U} C_{\Gamma} \phi_2 . \]

Future Work

- Study the decidability of model checking for the logic,
- Complexity if decidable,
- Axiomatization?
- Abilities of subgroups of agents,
- Include memory abilities in the logical language: be able to express properties like “$a_1$ is memoryless”
- Use strategy logic to discuss strategies explicitly within formulas.
Thank you.
